INTRODUCTION

THE ardent collector of Pottery or Porcelain, even when he has long passed his "novitiate," constantly feels the need of a reliable pocket volume containing the authentic and indisputable marks of the pottery and porcelain of the best "collectors' " periods. It has been our aim to supply such a volume in a condensed and practical form. The only marks given in this book are those which are beyond dispute. The arrangement is geographical, the different species of ware being separately treated wherever practicable ; but, by elaborate indices, ready reference has been provided to each mark, as well as to each factory. In addition, a condensed account of the important productions of every country prefaces each section of the work. The aim, throughout, has been to render the work as complete and self-contained as such a pocket manual can be ; though, in his study, the collector will naturally turn for fuller information to the important histories or monographs, such as those mentioned in the bibliography.

It has been assumed that the collector is acquainted with the broad distinctions of Simple Pottery, Faïence, Stoneware, and Porcelain. The terms are used here in a very definite way.

SIMPLE POTTERY includes all the forms of earthenware whether made from white or coloured clays, glazed with a transparent lead glaze.

FAÏENCE includes all the forms of earthenware, coated with tin-enamel, such as Majolica, Delft, and their related types.

STONEWARE includes the hard, vitrified and impermeable kinds of earthenware, whether Rhenish, English, or Oriental.

PORCELAINS are the translucent and (generally) white forms of pottery.

The porcelains are classified in the customary way, as hard-paste or soft-paste. The hard-paste group includes such well-defined types as the Chinese, Japanese, German, and modern Continental porcelains. The soft-paste group includes all the porcelains in which the fired body is distinctly softer than in the former group. The soft-paste porcelains comprise two distinct varieties, which are of widely different value to the collector.

- A. The soft-paste glassy porcelains (invaluable on account of their quality and rarity), such as those made at Florence (sixteenth century), Rouen (seventeenth century), and the early French and English porcelains (eighteenth century);
- B. The soft bone-paste porcelains, such as the English porcelains made in the later eighteenth and throughout the nineteenth century.

So much attention has been paid to marks that it may be necessary to state clearly the exact value of a mark. Other things being equal, a marked example of any period is more valuable than an unmarked one. But the mark alone must not be considered as the sole criterion of excellence or even market value. Unfortunately since factory or workmen's marks have become general, quite a large proportion of pieces have been sent out without any distinctive mark, especially in bygone centuries. This has been the opportunity of the forger and "faker," and the reader is earnestly warned to be on his guard against their abominable cleverness. The marks which are most difficult to imitate, and are in that respect most reliable, are those which occur under the glaze; as was generally the case before the eighteenth century. During the eighteenth century there was a gradual introduction of marks painted, printed, or stencilled over the glaze, and this practice

has been increasingly followed, with some exceptions, to the present day.

The under-glaze marks are of two kinds : (a) those stamped or incised in the body of the ware while it is still soft. These are perhaps the most reliable of all marks, for once made it is very difficult to remove or alter them. They may, however, be so imperfectly formed, or have been so obliterated by the glaze as to be deciphered with difficulty. (b) Marks painted under the glaze. This is the most important class of marks, being found on Oriental porcelain, Persian earthenware, European faïence, and nearly every kind of European pottery and porcelain. Down to the end of the eighteenth century, practically all under-glaze marks were in blue (the most available colour), and it is only in the nineteenth century, as a rule, that under-glaze marks in black, pink, or green are found. Many of these later marks are printed and not painted. In all the old wares, where not otherwise specified, it may be taken for granted that the mark is painted in blue.

With the introduction of over-glaze, or enamel, colours and gilding in the eighteenth century we get an increasing use of marks in the same style. The fact that these marks are painted over the glaze detracts greatly from their value, for several reasons. Such marks are easily added to any piece of pottery or porcelain, as they can be fired at a temperature that will not seriously impair the previous decoration. Genuine over-glaze marks can be readily removed and a more valuable mark substituted, so that they cannot be regarded in themselves as being so safe and trustworthy as those which occur under the glaze.

The marks themselves consist of factory names, or trade-marks as they are called nowadays, the signatures of potters, painters, or gilders, with or without dates and descriptive notes, placed in some inconspicuous place, occasionally in the design, but generally under the base of the piece. Some of them, especially the early ones, afford precise information as to the origin of the piece on which they occur, but others are mere workmen's signs or pattern marks, or numbers which are of little value unless supported by other evidence. The

tendency of many old factories (and some modern ones) to borrow each other's marks, or to adopt signs similar to those in use at some more famous works, is a source of endless confusion which can only be avoided by a knowledge of the wares themselves.

The period covered extends roughly from the Middle Ages to 1850, though a selection of certain modern marks has been included, especially of such wares as are already finding favour with collectors. No attempt has been made to reproduce the exact size of the individual marks, because of the constant variations in size and form of the same painted mark on different pieces. Stamped and written names have been reproduced in Roman and Italic types respectively, except in those cases where striking individuality of script rendered a direct copy necessary. Each new factory, or group of factories, as it occurs is printed in conspicuous type. The dates given for the European wares require no explanation, but in the Oriental sections, with which especial pains have been taken, the dates are those of the actual specimen from which the mark was copied. These Oriental marks cannot be regarded as date-marks when they are mere symbols or benevolent expressions.

Special acknowledgments are due to M. Papillon, the author of the *Guide to the Ceramic Museum at Sèvres*, for permission to use his complete list of Sèvres Marks; to Professor E. S. Morse, for a similar courtesy with regard to his invaluable *Catalogue of the Japanese Pottery in the Museum of Fine Arts, Boston, U.S.A.*; and to Mrs. Hobson, for assisting in the compilation of the Indices.

ITALIAN MAIOLICA

THE term MAIOLICA is applied in these pages to the decorated Italian pottery made from the fifteenth century onwards, though it is often used to embrace certain kinds of ware to which the name is not strictly applicable, viz. mezza-maiolica, *graffiato* wares, and the later lead-glazed, white earthenwares of the eighteenth and nineteenth centuries.

MEZZA-MAIOLICA is the name given to a common buff earthenware, coated with a wash of white clay (slip), and painted in simple, often crude tints of green, blue, and purplish brown, under a thin colourless glaze. It was the precursor of true maiolica.

GRAFFIATO ware is a mezza-maiolica, with a substantial coating of white slip, which was decorated by scratching or cutting out a pattern through this slip-covering, so as to disclose the buff or red body beneath—colours, if used at all, were usually added in patches or washes—and in any case the ware was finished with a clear, straw-coloured, lead glaze. This, like the painted mezza-maiolica, was a very early type of product, which, however, has continued in use, in the north of Italy especially, to the present time.

MAIOLICA proper was fashioned in a buff ware, more carefully prepared and closer in texture than mezza-maiolica, and is coated with a white, opaque layer of tin-enamel (instead of slip), on which the painter laid his colours: the later and more delicately painted maiolica was finished with an additional thin coat of colourless glaze, applied over the fired colours, like the varnish over a picture. Up to the eighteenth century one firing sufficed for the colours and the tin-enamel, and only such pigments could be used as would stand the full heat of the maiolica kiln. The marks, on wares of this period, are almost always in blue.

Early in the eighteenth century a new process was introduced. The body and its tin-enamel coating were baked and finished first, then the decoration was applied to the fired surface in on-the-glaze colours, which were fixed at a comparatively low heat in the enamelling kiln. From this time marks in various colours on the glaze became common.

The most famous period of true maiolica was from about 1500 to 1560 when the typical decoration consisted of pictorial subjects copied from engravings after the great Italian painters. The marks at the period are often very elaborate, and tell us not only the name of the painter of the piece, but the bottega or factory in which he worked, the name of the master under whom he served, and the title of his subject. Hence the frequent occurrence of such words (sometimes in contracted form) as bottega, maestro, vasaro (potter), pictor, fatto (made), fecit, pinxit, etc. On the lustred wares of Diruta and Gubbio the mark is usually in lustre. Maestro Giorgio Andreoli of Gubbio (*q.v.*) was famed for his skill in the production of lustres, especially ruby lustre, and the potters of other towns sometimes sent their pieces to Gubbio, after they had been painted and fired, to be embellished with lustre by Giorgio. Such pieces bear Giorgio's mark in lustre, in addition to the mark or signature of the original painter, which is in blue.

ITALIAN PORCELAIN

THE earliest Italian porcelain, of which marked examples are known, was made at Florence under the patronage of Francesco Maria di Medici in the last half of the sixteenth century, and is called "Medici Porcelain." This "Medici" porcelain owed its translucence to the glass used in its preparation. It is among the rarest of ceramic treasures, and an authentic specimen is worth many times its weight in gold. Nothing more is heard of Italian porcelain until about the middle of the eighteenth century, when the rage for porcelain manufacture was at its height in Europe.

Hard porcelain in imitation of the celebrated Meissen porcelain, as well as soft-paste porcelain, was then made at Venice successively

by Vezzi, Hewelche, and the Cozzi family. The more famous porcelain made at Doccia (1737 onwards) was a soft paste during the early years of the factory, but a hard paste was made afterwards, and the same may be said of the royal factory, started at Capo di Monte in 1743, and subsequently transferred to Naples. At Treviso and Vinovo another kind of porcelain, containing silicate of magnesia, was produced for a few years at the end of the eighteenth century. This ware has a yellowish waxen appearance, and is peculiar to certain Italian and Spanish factories.

GERMAN POTTERY

A NUMBER of potters in Germany and Switzerland from the sixteenth century onwards were engaged in the manufacture of elaborate stove-tiles, usually ornamented with reliefs in sunk panels and coloured with slips, glazes, and tin enamel ; brown, yellow, green, blue, maganese purple, and white were the principal colours used. The manufacture of tin-glazed faïence after the Italian and Dutch styles was common in most parts of Germany in the seventeenth and eighteenth centuries ; and a certain amount of slip-decorated and graffiato earthenware was made in South Germany, at Gennep in Luxembourg, and at Schaffhausen in Switzerland, in the eighteenth century.

In the Rhenish provinces a large stoneware industry developed in the sixteenth century at Siegburg, Raeren, Cologne, Frechen, and elsewhere, and during the two following centuries at Grenzhausen in Nassau. The typical Rhenish stoneware varies from white to freckled brown, and is ornamented with panels in low relief made in moulds and applied, as well as with stamped and incised decoration : the ware was glazed with salt, and sometimes coloured with patches of cobalt blue and maganese purple. The cutting of moulds for the reliefs was an important branch of this industry, and most of the marks are those of the mould-cutters, and appear in relief in the panels. Bottles with a bearded mark on the neck, known as Bellarmines or Greybeards, are the commonest specimens of Rhenish stoneware. The tall, tapering tankards of white Siegburg ware are among the best examples of this class. Another variety, made chiefly at Kreussen, is heavily painted in enamel colours.

GERMAN PORCELAIN

THE secret of true or hard-paste porcelain, after the manner of the Chinese, was discovered about 1707 at Dresden by J. F. Böttger, an alchemist, in the employ of Augustus II. of Poland, Elector of Saxony. He discovered about the same time the method of making a fine red stoneware, now known as Böttger ware, but called by him red porcelain. This ware was finished by polishing on the lathe, or covering with a black glaze and enriching with gold and silver ornament or engraving. Böttger and his secrets were transferred in 1710 to Meissen, where he started the celebrated Meissen porcelain factory under strict surveillance. The process, however, could not be kept hidden, and escaped workmen carried the secret first to Vienna and afterwards to all parts of Germany. Factories sprung up in one principality after another under the protection of the ruling houses, who vied with each other during the eighteenth century in the production of true porcelain. All the German porcelain is hard paste, varying in fineness according to the sources of the porcelain clay. The finest material was obtained from Aue in Saxony, and a coarser earth mined near Passau produced the greyer and inferior wares made in the Thuringian factories at the end of the eighteenth century. Each factory had its distinctive mark usually painted in blue under the glaze, though among the minor factories, particularly those of the Thuringian district, there was a tendency to use marks suspiciously similar to the Meissen crossed swords. The latter mark is sometimes found with one or two cuts across it: this signifies that the ware was faulty and rejected by the Meissen factory as unfit for decoration, and any ornament on pieces so marked must have been added elsewhere.

THE NETHERLANDS, SCANDINAVIA, RUSSIA, SWITZERLAND, AND ALSACE-LORRAINE

THE tin-glazed earthenware made at Delft in Holland is so celebrated that the word delft has come to be used as a generic term for the stanniferous wares of the North of Europe. Though the use of tin glaze was understood in the Netherlands at least a century earlier, it was about the year 1600 that the manufacture developed in Delft. The processes used at Delft were in most respects similar to those of the Italian maiolica potters (see p. 1), but the results were very different owing to the divergent styles of decoration affected in the two countries. The object of the potters of Delft was to make a ware resembling blue and white Oriental porcelain. Hence the predominance of Oriental forms and of blue painting after the style of the Chinese. Towards the end of the seventeenth century coloured ornament in "Old Japan" style came into fashion, and still later enamel painting on the glaze was adopted. The marks of the earlier wares are usually in blue: the coloured specimens were often marked in colours or gold. The marks are as far as possible grouped in factories each of which had its sign, like an inn, *e.g.* The Three Bells, The Flower Pot, The Claw, etc. The remaining marks are arranged chronologically, the last being that of Jan Van Putten & Co., with whom the old Delft industry may be said to have ended in the first half of the nineteenth century, though imitations of the old wares are made at this day. The manufacture of tin-glazed wares showing the influence of Delft spread rapidly over the North of Europe; England, Scandinavia, and the North of Germany numbered many factories, while in France the manufacture became national and developed a character of its own. The tin-enamelled wares died out gradually owing to the improvements in the making of porcelain and the cheaper and more serviceable

English earthenwares invented in Staffordshire at the end of the eighteenth century.

A red unglazed ware after the manner of the Chinese "buccaro" was made in Holland by de Milde and de Calve early in the eighteenth century.

A few hard-paste porcelain factories were established in Holland and Belgium towards the end of the eighteenth century, and an important manufacture of soft-paste porcelain, after the French fashion, flourished at Tournay from 1750-1799.

The principal Scandinavian potteries were at Herrebøe, Rörstrand (a district of Stockholm), and at Marieberg. Tin-enamelled faïence after the fashion of Delft was the chief product, though porcelain also was made at Marieberg for some years.¹ The hard-paste porcelain of Copenhagen was first made in 1772, and the factory holds an important position for its artistic wares at the present time. It had been preceded by the manufacture of soft paste, examples of which are very rare.

Russian porcelain was made principally at the Royal factory in St. Petersburg, and by Gardner and Popoff in Moscow: hard paste, after the manner of Meissen, was made at both places.

Stove-tiles, slip-wares, and tin-enamelled faïence were produced in considerable quantity in Switzerland in the seventeenth and eighteenth centuries, chiefly at Winterthur, Zurich, Schaffhausen; and porcelain works flourished at Zurich and Nyon, making chiefly hard-paste porcelain, though soft paste was tried for a time at Zurich.

In Alsace-Lorraine the principal factories were those of Strassburg, Hagenau, and Niderviller where good faïence and hard-paste porcelain were made in the eighteenth century. The Strassburg faïence is noted for its rococo forms and its enamelled decoration resembling the painting on porcelain. Fine earthenware and terra-cottas were made at Lunéville and at Niderviller, the figures and groups modelled by Cyfflé at the former place, and Lemire at the latter being justly celebrated.

¹ The factory at Rörstrand has for many years produced many varieties of porcelain, earthenware, and stove-tiles. Its present-day porcelain is worthy of note.

FRANCE

IT is not yet definitely settled where the celebrated "Henri II. ware" was made. Formerly it was supposed to have been made at the Castle of Oiron, near Thouars, but it is now more generally assigned to the neighbouring village of Saint-Porchaire. This ware is very rare and remarkable. It is a fine, glazed earthenware of ivory colour, with stamped patterns, like those on contemporary book-bindings, inlaid with darker clays, and occasionally touched with colour. The shapes are carefully and elaborately moulded; and the occurrence of the royal arms, and the cyphers of Henri II. and Diane de Poitiers attest the royal appreciation of the ware. Commoner lead-glazed earthenwares were made from early times at Beauvais, and in the neighbourhood of Saintes, but they are rarely marked. Nor has any marked example of undisputed Palissy ware been found. Bernard Palissy, the most renowned of French potters, was born about 1510 near Saintes, and by extraordinary patience and all-sacrificing industry succeeded in making the peculiar type of pottery associated forever with his name. It is a fine dense pottery with rich lead-glaze mottled or splashed with blue, green, purple, and yellow: most of the pieces are enriched with relief designs, but perhaps the most characteristic are the rustic dishes with accurately moulded shells, lizards, eels, and aquatic creatures in relief and coloured after nature. Palissy is said to have died in the Bastille about 1592. His sons continued the work, and among his other followers were several potters at Avon, near Fontainebleau, including Barthélemy de Blémont, to whom the mark B B (p. 59) is attributed. Palissy ware has been frequently copied, Pull of Paris, about 1850, being particularly successful in this work.

In the seventeenth and eighteenth centuries the French potters devoted themselves to the manufacture of tin-enamelled faïence,

first in imitation of Italian maiolica, and afterwards of Dutch delft. The processes employed were essentially the same as those described on page 1 in connection with the Italian ware. Indeed the art was introduced into the south of France by Italian potters at the end of the sixteenth century, and the early wares of Lyons and Nevers are purely Italian in style. Among the many forms of decoration adopted on French faïence five distinct schools are observable :—(1) The Italian. (2) The Persian style adopted at Nevers for a short period in the seventeenth century; it consisted of white floral ornament on a deep blue ground. (3) The Rouen school, characterised first by the use of scalloped borders and embroidery patterns, recalling lace work, and afterwards by a commoner decoration, in which a cornucopia is the central motive. (4) Delicate arabesques with Chinese figures and interlacings, after the designs of Berain, adopted at Moustiers early in the eighteenth century. (5) Enamelled bouquets of flowers and landscapes in scroll-edged panels, after the manner of the porcelain painters, introduced at Strassburg, and largely developed at Marseilles and elsewhere in the eighteenth century. About 1780 “cream-colour” and other English forms of fine earthenware threatened to oust the national faïence, and attempts were made to produce the English types of earthenware, notably at Douai and Creil. The marks on French faïence are mostly painted in blue, sometimes in colours.

FRENCH PORCELAIN

FRANCE was the home of soft-paste porcelain. At the end of the seventeenth century this ware was successfully made, first at Rouen, then at St. Cloud, and a few years later it was made at Lille, Mennecey, and Chantilly. The perfection of soft paste was reached at Vincennes and Sèvres between the years 1740-70. The true soft-paste largely consists of a glassy composition or frit mixed with sand and marl or pipe-clay and other ingredients, and is coated with a luscious lead-glaze of creamy tone. The body is tender enough to be easily scratched with a steel point, and the glaze is so soft that the enamels painted upon it sink in and become incorporated in the moderate heat of the

enamelling kiln. The ware is very beautiful, but unsuited for household usage. About 1768 the manufacture of true or hard-paste porcelain from natural clays and rocks was introduced at Sèvres, and very soon superseded the soft-paste there and elsewhere in France. It was made in large quantities in Paris from about 1770 to the end of the century, but since then the chief centre of production has been Limoges. Figures and groups in "biscuit" or unglazed porcelain were made in both hard and soft paste. These are usually marked by incising in the raw body, whereas the glazed wares are marked by painting in under-glaze blue, over-glaze red, and other colours or gilding, and on the modern wares by printing chiefly in red.

A number of marks probably of painters from c. 1750 onwards.

Numbers also occur referring to the value of the ware.

Single letters also occur on ware made in two pieces (e.g. sugar-casters) to identify the parts.

SPAIN AND PORTUGAL

THE manufacture of a tin-enamelled earthenware decorated in blue, manganese and green, or in blue and lustre pigment, or in lustre alone, flourished in Spain from an early date, and was most probably introduced by the Moors. Manises and Valencia were centres of the industry, which was at its best in the fifteenth and sixteenth centuries. In the seventeenth century several Italian potters settled in Spain, and introduced the manufacture of their, then decadent, maiolica there. Later, when French faïence was at its height, some French potters removed to Spain, so that during the seventeenth and eighteenth centuries tin-enamelled wares were made at Alcora, Talavera, and elsewhere, some of which recall the later styles of Italian maiolica, while others resemble French faïence. Wall-tiles with elaborate geometrical patterns of Moorish origin, known as *azulejos*, were largely made in Spain from early times, and formed a special industry.

Porcelain was manufactured in due course in the eighteenth century, the most important factory being that of Buen Retiro, near Madrid, founded in 1760 by the help of workmen and moulds removed from Capo-di-Monte, Naples. The ware was at first a soft paste, but after 1780 a harder magnesian porcelain was made.

Clever copies of Palissy ware and the mottled earthenwares of Staffordshire are made by Mafra, at Caldas, in Portugal.

			c. 1844 Stoneware

THE BRITISH ISLES

VARIOUS attempts to make porcelain in the neighbourhood of London culminated in factories of Bow and Chelsea, both of which were active as early as 1745. The ware was a soft-paste porcelain, the secret of which had been learnt, no doubt, from French potters. Shortly after 1750 other factories sprung up at Derby, Worcester, Lowestoft, Longton Hall, Bristol, and Liverpool. All the early English porcelains were varieties of soft-paste, some distinguished by the admixture of bone-ash, and others by that of steatite. The only true hard-paste porcelain was made of Cornish materials at Plymouth from 1768-70 and at Bristol from 1770-81. The English porcelains continued to vary under fresh experiments till the end of the eighteenth century, when a more permanent mixture was arrived at by Josiah Spode in Staffordshire. This was the modern English porcelain, made chiefly of China clay and China stone from Cornwall, and bone-ash; it combines the strength of hard-paste with some of the soft mellowness of the old soft-paste porcelain. The decoration passed through regular phases, first copying the Chinese white wares, then the blue and white, then the enamelled Japanese porcelain exported from Imari; next came imitations of the Meissen and Sèvres styles, from the rococo to the pseudo-classical; and at the beginning of the nineteenth century the Japan patterns were revived in a very free rendering of the more elaborate "Imari" designs. After this the potters fell back on imitations of the earlier styles until new life was infused into their work at the end of the last century.

Marked specimens of English earthenware are practically unknown before the seventeenth century. It was then that delft or tin-enamelled ware in the Dutch fashion began to be made, chiefly at Lambeth: this industry spread over the country in the eighteenth century, and considerable factories sprung up at Bristol

and Liverpool. In Staffordshire and at Wrotham in Kent, in Derbyshire and other places the more English method of decorating earthenware with coloured slips was largely practised, and many of the pieces bear the names or initials of potters as well as those of the destined possessors of the pots. At the end of the seventeenth century salt-glazed stoneware was made by Dwight of Fulham, and at Nottingham, and a fine red stoneware after the Chinese *buccaro* was made by Dwight and by Elers in Staffordshire. Early in the eighteenth century the Staffordshire potters became celebrated for a fine, white, salt-glazed stoneware of remarkable thinness and sharpness which is called "salt-glaze" par excellence. This was followed by a lead-glazed earthenware of creamy-yellow tone perfected by Wedgwood in his Queen's ware about 1760. It was decorated, first with splashes and mottlings of green and brown or brownish-purples, and afterwards by painting in enamel colours. Towards the end of the century numerous earthenwares and stonewares were invented or perfected by Josiah Wedgwood and his contemporaries, *e.g.* jasper wares, black basalt or Egyptian black, cane-coloured stoneware, pearl-ware, etc. ; and in the early nineteenth century a host of iron-stone chinass, improved stone chinass, etc., mostly hard white earthenwares, were invented as cheap substitutes for porcelain. Marks on English pottery are mostly impressed and are often difficult to decipher because the glaze has filled up the hollows of the stamp.

PERSIA, SYRIA, ASIA MINOR AND EGYPT

THE pottery of the Near East, while embracing many kinds of earthenware, is usually characterised by a friable body of sandy texture: this is occasionally coated with tin-enamel, oftener with white "slip," though it is sometimes decorated directly on the body. Painting in blue and brown, turquoise and green, or in lustre pigments was practised from very early times, and the ware, except when tin-enamelled, has a translucent glaze of remarkable depth and quality. It appears probable that Egypt was the nursery of the art after the fall of the Roman Empire and in the early Middle Ages, and that its practice spread thence into Syria, Persia, and Asia Minor, where brilliant and attractive types of pottery were made from the eleventh to the seventeenth century. The rubbish mounds which cover the site of Fostat (Old Cairo) have proved rich mines of fragments and waste pieces of pottery evidently thrown away from kilns—many of which bear marks; some of the marks show that Persian and Syrian potters, or their descendants, were working in Egypt alongside the native Egyptians. Indeed the most common name *Ghaiby* signifies "stranger," and is qualified on one piece with the further description *El Châmy*, "the Syrian." The dates of these marked fragments range from the ninth to the seventeenth century.

Lustre pigments were used with great skill in Persia from the thirteenth to the seventeenth century, and perhaps also in Egypt at an earlier date. Under Turkish rule, from the sixteenth century onwards, a particularly beautiful pottery of the same type was made in Asia Minor and at Damascus. This ware, formerly known as Rhodian and Damascus ware, is noted for its brilliant colours and its decorative schemes of semi-naturalistic flowers—pinks, hyacinths, marigolds, roses, fritillaries, etc. A large propor-

tion of this ware, exclusive of that made at Damascus, is distinguished by the use of a fine red pigment, always in palpable relief. This pigment, generally known as "Rhodian red," was obtained from Armenian bole.

Marked examples of Persian, Syrian and Turkish wares are uncommon.

A translucent pottery, which is generally known as Persian porcelain, was made at a very early date, and then again about 1600 and even as late as 1800. This ware frequently bears delicately incised patterns or is ornamented with pierced patterns the openings of which are filled with glaze. It was formerly known in England as "Gombroon Ware."

The marks found on Persian pottery occur most frequently on the wares of the sixteenth to the nineteenth century, particularly on the pieces in which Chinese influence is apparent in the decoration. Marks also occur on Anatolian wares of Minor importance.

CHINESE PORCELAIN

It seems probable from literary evidence that porcelain was made in China at least as early as the T'ang dynasty (618-907 A.D.), but no examples of this period have reached Europe. The various makes of the Sung (960-1279) and Yuan (1280-1367) dynasties are known to us chiefly through a few of the coarser specimens of the creamy white ware of Ting-chou and the grey green celadon of Lung-ch'üan-hsien, and through the comparatively modern copies which abound. Marks on these wares appear to have been unusual, though we read that the Chün-chou porcelain was sometimes marked with an engraved numeral, and a palace mark of the Yuan dynasty (*Shu fu*) is given on p. 149. Under the Ming dynasty (1368-1644 A.D.), the Yung-lo period (1403-24) was celebrated for its fine white porcelain with engraved ornament; the Hsüan-tê period (1426-35) for blue and white (*i.e.* white porcelain painted in underglaze blue) and a brilliant underglaze red decoration; the Ch'êng-hua period (1465-87) for coloured decoration, painted in enamels and in glazes; the Hung-chih period (1488-1505) for a pale transparent yellow; the Chia-ching period (1522-66) for blue and white; the Lung-ch'ing (1567-72) and Wan-li (1573-1619) periods for enamelled decoration combined with underglaze blue, principally in five colours, including green, yellow, manganese purple and red. Genuine specimens of Ming porcelain made before the sixteenth century are practically unprocurable, though the marks of Hsüan-tê and Ch'êng-hua occur very commonly on comparatively modern wares.

The reigns of K'ang-hsi (1662-1722), Yung-chêng (1723-35) and Ch'ien-lung (1736-95) have supplied practically all the finest Chinese porcelain in European collections. The K'ang-hsi period is noted for the perfection of blue and white porcelain; enamelled

porcelains in three and five colours,¹ with a predominance of green in various shades, whence the French name *famille verte*; porcelain with coloured grounds, e.g. greenish-black, powder-blue, coral-red, coffee-brown, leaf-green, etc., and reserved decoration in other colours; single-coloured wares with glazes of *sang de bœuf* red, peach-bloom, apple-green, and other tints. The reign of Yung-chêng (1723-35) was noted for the clever imitations of the ancient wares of the Sung dynasty with single-coloured, splashed, and crackled glazes. Indeed most of the archaic-looking specimens in our collections, with glazes of this description, were made about this time. Among enamels the various rose tints which came into use at the end of the preceding reign, were fully developed; and this period marks the transition of the *famille verte* into the *famille rose*, the old translucent enamels of limited range being replaced by an extended palette of opaque colours. The elaborately and minutely painted "egg-shell" plates and services (often with ruby-red ground underneath) were decorated at Canton mainly for export; and from this time onward large consignments of porcelain decorated to order with crests and coats of arms were shipped to Europe. The porcelain itself was made, like nearly all the Chinese porcelain known to us, at Ching-tê-chên,² in the province of Kiangsi, but the enamelled decoration in Western taste was added in Canton.

During the long reign of Ch'ien-lung (1736-95) mechanical perfection was reached in the manufacture of porcelain. There was little, old or new, that the potters could not achieve. Their glazes imitated jade, bronze, carved wood, lacquer, natural stones, and all kinds of ornamental materials; and many new glaze colours were adopted, e.g. *soufflé* red of coral tint, deep sapphire blue (known as the "Temple of Heaven" blue), "iron-rust" and "tea-dust" glazes. The painted wares are wonders of manipulative skill, though their delicate and elaborate finish may not be so pleasing as the bolder style and broader effects of the K'ang-hsi porcelains. A gradual but sure decline set in after the reign of Ch'ien-lung, and the nineteenth-century porcelain can usually be distinguished from the old wares by its inferior potting, weaker

¹ The enamels are always translucent, and at this time an overglaze enamel blue largely replaced the underglaze blue in the five-colour decoration.

² The principal exception to this statement is the ivory-white porcelain known in France as *blanc de Chine*, which has been made in the province of Fu-chien from the early part of the Ming dynasty.

colours, and comparative poverty of design. Marks on Chinese porcelain group themselves as follows:—(A) Date marks. (B) Hall marks. (C) Marks of commendation, description, etc. (D) Signatures. (E) Symbols. The inscriptions are either in ordinary script or in ancient seal characters (see p. 136), the ideographs being arranged in parallel columns, read from the top, and the columns taken from right to left. The mark is nearly always under the base and sometimes enclosed in a double ring, but on some of the older specimens it occurs on the side or neck of the vessel in a single vertical or horizontal line. It is usually painted in blue under the glaze; though it also appears in red, black or gold on the glaze, particularly on wares of the present dynasty; and it is sometimes stamped like a seal in the body of the ware.

(A) DATE MARKS.—Chinese dates are reckoned by two systems of chronology.—(1) Cycles of sixty years; (2) the *nien-hao*, *i.e.* arbitrary names given by the Emperors to the periods during which they reigned.

1. *Cyclical dates* are not common and are, as a rule, inconclusive, because they mention only the year of the cycle without specifying the cycle itself. The Chinese cycles are reckoned from B.C. 2637; but the table on p. 133, which begins at the 45th cycle and ends with the 76th (*i.e.* A.D. 4 to 1923), will suffice for ceramic purposes. Each year of the sixty is known by a name composed of one of the "Ten Stems" combined with one of the "twelve Branches," which are also the names of the signs of the Zodiac. Two examples will explain their use:—

¹ Wu-ch'ên ² nien ³ Liang-chi ⁴ shu = painting of Liang-chi in the ⁵ Wu-ch'ên ⁶ year. The first two characters will be found to

represent the fifth year in the table, but no indication is given of the cycle to which it belongs. The second instance is exceptional

and the date can be guessed. It reads Yu¹ hsin²-ch'ou³ nien⁴ chih⁵ = made in the hsin-ch'ou year recurring. The hsin-ch'ou year, the 38th of the cycle, recurred in the reign of Kang-hsi who completed a full cycle of his reign in A.D. 1721.

2. The commonest system of dating porcelain is by the *Nien-hao*, or reign-name adopted by the Emperor on the New Year succeeding the death of his predecessor. These dates are usually written in six characters in two columns; the name of the dynasty coming first, followed by the reign-name of the Emperor; the usual ending is *nien* (year or period) *chih* (made), but the latter word is occasionally replaced by *tsao* which also

⁴化 ¹大 means "made" (see p. 150) e.g. ¹Ta ²Ming
³Ch'êng ⁴hua ⁵nien ⁶chih = made in the Ch'êng-
⁵年 ²明 hua period (of the) great Ming (dynasty).
⁶製 ³成 The mark is sometimes shortened into four
 characters by the omission of the name of
 the dynasty, (see p. 136). The individual year
 of the reign is very rarely specified. Occasion-
 ally the word *yü*, Imperial, is used instead of *nien*: (see p. 150).

The reader is cautioned that these reign-marks cannot be accepted as true dates, without other evidence. The Chinese, who venerate antiquity, make a practice of putting ancient dates on modern wares. *Hsüan-tê* and *Ch'êng-hua* in the *Ming* dynasty, *K'ang-hsi*, *Yung-chêng* and *Ch'ien-lung* of the *Ch'ing* dynasty are commonly used in this way, because of the ceramic greatness of the reigns indicated. The exception to this caution is the Imperial porcelain, on which the mark is accurately and skilfully inscribed.

The following tables include the principal reign-names of the *Ming* and *Ch'ing* dynasties, marks previous to these being virtually unknown, although they are reputed to have been first placed on Imperial wares by order of the Emperor Chên-tsung in the period *Ching-tê* (1004-7 A.D.). From the reign of *Yung Chêng* onwards seal characters were commonly used in the reign-marks, as shown below. A list of Chinese numerals is appended.

(B) HALL MARK.—The term "hall" here used is vague but comprehensive. It may refer to the shed of the potter, the studio of the painter, the shop of a dealer, the hall of a noble

or the palace or pavilion of an Emperor. It may equally signify the place where, or the place for which the ware was made; and in the absence of any preposition the meaning of the hall-mark must often remain obscure. The word used in those marks is usually *fang*, a hall (see p. 142); but *ting*, a summer-house also occurs, as well as *chai*, a studio (p. 144), *hsuan*, a terrace (p. 151), and *fang*, a retreat (p. 143).

(C) MARKS OF COMMENDATION, etc., include (1) laudatory terms such as *Pao shêng* (of unique value) on p. 147, "a gem among precious vessels of rare jade" (p. 146), etc., referring to the beauty of the ware; (2) words of good omen such as *Shou* (longevity), *Fu* (happiness), etc., implying a wish for the welfare of the owner of the vessel; and (3) inscriptions which refer to the subject of the decoration, e.g. *Tsai ch'uan chih lo* = "Feeling pleasure in the water," the subject being fishes in a pool (p. 147).

(D) SIGNATURES are rare on Chinese porcelain, chiefly because of the minute division of labour in the factories, where one piece sometimes passed through seventy hands. Some of the "hall marks," however, must be regarded as containing "studio names" of potters or decorators, and therefore as a kind of signature.

(E) SYMBOLS, DEVICES, etc., so dear to the Chinese mind, are often found in place of a written mark, the commonest being the Eight Buddhist symbols, the attributes of the Taoist Immortals, the Hundred Antiques, and Emblems of Happiness or Long-life such as the bat and the fungus. More rarely a group of objects can be translated rebus-fashion into a good wish; e.g. a pencil-brush (*pi*) with a cake of ink (*ting*) and a (*ju'i*) sceptre or magic wand, together connote the phrase *Pi ting ju'i*, "May (things) be fixed as you wish" (p. 141).

In the year 1667 the Emperor K'ang-hsi forbade the use of the Imperial title or any sacred phrase on china, lest it should be broken and desecrated. It is unlikely that the prohibition remained in force for more than a few years, but during that time the double ring intended to enclose the mark either remained blank or was filled with a device or symbol or some other permissible substitute.

CHINESE POTTERY

THE manufacture of pottery in China is of immemorial antiquity, but its history prior to the Han dynasty (B.C. 206–A.D. 220) is only of antiquarian interest. At this time it appears from literary evidence that stoneware, a very hard and partially vitrified pottery, was made; and from actual existing specimens that a red earthenware with green or yellow glaze was fashioned in vases of more or less artistic form, borrowed from the still more ancient bronzes. The spread of tea-drinking during the T'ang dynasty (A.D. 618–907) proved, no doubt, a great stimulus to the potters, but we know little about the results of their efforts before the Ming dynasty (A.D. 1368–1644). It was in the reign of Chêng-tê (1506–1521) that the potteries of Yi-hsing-hsien, in the province of Kiangsu, were started. The Yi-hsing ware is an unglazed pottery of varying hardness, and usually of red, buff, or fawn colours. It was called by the Portuguese “buccaro,” and is best known in tea-pots of fantastic shapes, such as Böttger of Dresden, certain Dutch potters, and Dwight and Elers in England copied at the end of the seventeenth and the beginning of the eighteenth centuries. The later examples are often enamelled and the manufacture continues to this day. Important stoneware factories exist in the province of Kuang-tung, dating perhaps from the Sung dynasty (A.D. 960–1279), but best known to us by their later products, *e.g.* jars, vases, and figures with splashed and mottled glazes with a prevailing blue or bluish grey tone streaked and flecked with scarlet, green, and olive brown. There are potteries near Peking producing good copies of the porcelain with turquoise and aubergine glazes, and there are many obscure factories which supply local needs; but the Chinese pottery in European hands can, as a rule, be safely assigned to either a Yi-hsing or Canton origin.

Marks on Chinese pottery usually consist of impressed seals giving the name (or art-name) of the potter or place of manufacture; and date-marks are uncommon.

CHINESE NUMERALS

1	一	丨	壹	Yi
2	二	𠄎	貳	Erh
3	三	川	叁	San (rare)
4	四	乂	肆	Ssü
5	五	ㄅ	伍	Wu
6	六	上	陸	Liu
7	七	乚	柒	Ch'i
8	八	三	捌	Pa
9	九	久	玖	Chiu
10	十		拾	Shih

These Chinese numerals will assist in calculating those rare Chinese and Japanese dates in which a particular year, month, or day is specified. Three forms are given: the common form on the left, the short form in the middle; and the long form on the right. Chinese numerals of the common form were used as marks on the Chün-chou porcelain of the Sung dynasty (960-1279 A.D.).

The numerals in Japanese read:—1. Ichi. 2. Futatsu or Ni. 3. San. 4. Yotsu or Shi. 5. Itsutsu. 6. Mutsu or Roku. 7. Nanatsu or Shichi. 8. Yatsu or Hachi. 9. Kokohotsu or Ku. 10. Ju or To.

			Chin-Yüan-yu chih = registered by Chin-yüan-yu 19th cent.

JAPANESE POTTERY

THOUGH a primitive pottery was made in Japan before our era, it was not till the practice of tea-drinking necessitated a better class of ware that anything of artistic pretensions was made. In the thirteenth century Kato Shirozaemon, better known as Toshiro, journeyed to China to learn the secrets of the Chinese potters. On his return he made the first glazed wares, which consisted chiefly of tea-jars and tea-bowls of fine stoneware with rich streaky glazes, amber brown, chocolate, and purplish black, sometimes superposed. A yellow glaze was added in the next generation. These glazes, known as *Seto gusuri*, or Seto glazes, were for long the only covering for Japanese pottery. Towards the end of the sixteenth century, after the invasion of Corea, a number of Korean potters were transplanted to Japan by the victorious Hideyoshi and proved a powerful influence in Japanese ceramics. Tea-drinking became an organised cult, and the tea societies (*Chanoyu*) acquired a semi-political significance. In their ceremonies the tea-drinkers studied an almost rude simplicity, and the wares affected by them were of an archaic character, so that the potters had to devote themselves to copying the old Seto and Corean wares. The latter included wares with greyish-white glaze, or grey stoneware inlaid with white or black clays in what was called *Mishima* style. Another important class of tea-ware was a soft pottery with smooth waxen glaze in brown, black, salmon red, or yellow colours, known as Raku ware and introduced by a Corean named Ameya early in the sixteenth century. A seal engraved with the word *Raku* (Happiness) was given to Chojiro, the second generation of the family in 1588, and has been used by his descendants ever since. Raku ware was easily made and required only a low temperature in the baking; it has been manufactured

by a large number of potters, professional and amateur, in various parts of Japan.

Among the old factories Takatori was noted for rich, variegated and mahogany glazes of the Seto style; Karatsu and Hagi for wares of Corean type; and Shigaraki for rough archaic pottery with blistered and corrugated glaze. A rich brown or slatey grey stoneware, with no glaze at all or only an accidental covering, was made in Bizen from early times: admirably modelled figures and groups have for long been made at Imbe, in this province. A grey stoneware with translucent glaze specked with brown was made at Iwaki in the province of Soma, and was generally decorated with a tethered horse, the princely badge of the province. Grey ware with fine inlaid white ornament, a development of the Corean *Mishima* style, is peculiar to Yatsushiro; and the province of Ise is distinguished by the work of a clever amateur of the eighteenth century whose art name is Banko. He also worked at Yedo copying Raku, Corean, and Kioto wares. His seal was used by Mori Yusetsu, who revived his work in 1830, and who was further noted for the use of interior moulds for his fine stoneware teapots which show outside the finger-prints of the potter.

The Kioto potters worked in every style, but the district of Awata is specially noted for a beautiful pottery with hard greyish white body and translucent glazes varying from grey to cream colour and finely crackled. In the early part of the seventeenth century this ware was painted in blue or brown under the glaze; but in the latter part of that period the celebrated potter, whose art name is Ninsei, learnt the secret of enamelling on the glaze from the porcelain makers in Hizen. He was followed by the Kenzan, Kinkozan, Hozan, Taizan and other families whose descendants in many cases still produce the finely enamelled Awata faïence. But the most beautiful pottery of this type is the ivory white ware of the province of Satsuma, with its lustrous velvety surface and scarcely perceptible crackle. This ware, which probably dates from the seventeenth century, was at first undecorated; enamelled ornaments were sparingly applied in the eighteenth century, but in modern times the quality of the ware has degenerated and the mass of decoration increased. Indeed a large proportion of the ware is now sent to Tokio, where it is entirely covered with rich enamels and gilding. There were other and older wares made in the province of Satsuma with

glazes of Seto type, shrivelled glazes resembling shark-skin in texture, mottled tortoiseshell glazes, and brown painted designs, but these are little known or appreciated in Europe.

Another kind of pottery, in close imitation of a Chinese ware called by the Japanese Kochi-yaki, was successfully made by Zengoro Hozen, whose art name is Eiraku. This is a stoneware or semi-porcelain with turquoise, green, and purple glazes usually kept apart by the raised outlines of the ornament, but sometimes laid on singly over the entire piece. Eiraku flourished in the first half of the nineteenth century and his family still uses his seal. He worked at Kioto and in the province of Kishiu or Kii.

Marks on Japanese pottery are incised, stamped, or painted. The stamps or seals are by far the most numerous. They usually give the name of the potter or place of manufacture or, more rarely, the name of the Temple or place where the ware was sold. Japanese craftsmen almost always adopt an "art-name," sometimes more than one, and these are the names that chiefly occur in the potter's marks. Thus Zengoro Hozen signed with the name *Eiraku* and also with the seal *Kahin Shiriu* given to him by a princely patron, while Ogata Shinsho, best known by his art name Kenzan, is credited with at least ten pseudonyms.

Japanese potters worked singly, and the number of signatures of professional and amateur potters is immense.

Marks containing the words *tei* (house) and *yen* (garden) correspond to the Chinese "hall marks." The following list is a selection of the most important marks arranged geographically. Japanese marks are usually written in Chinese

堂¹園²

製

= tsukuru, sei, seisu, or zo = made

作

= saku = made

製
衣
之

= Koreo tsukuru = made this

筆

= hitsu = drawn

造

= sei = made (synonym of *tsukuru*)

画

= ga or yegaku = painted

script or seal characters, more rarely in the cursive Japanese writing. They commonly end in the word *sei* or *tsukuru* (Ch. *chih*) = made, varied by such words as *saku* = made : *hitsu* (pencil) = drawn : *ga* or *yegaku* = painted. *Tsukuru* followed by the word *Kore* (=this) is read *Kore o tsukuru* = made this. Sometimes the mark ends in, or solely consists of a *Kakihan*, i.e. written seal (see p. 179), a flourish or sign without literary meaning.

Date marks are given in two ways as on Chinese wares : (1) the cyclical system which is identical with the Chinese (p. 129) ; (2) the *nengo* which corresponds with the Chinese *nien hao*, being a period, the name and length of which are determined by the Emperor. The list of *nengo* began in 645 A.D. ; but the following section beginning in 1370 is sufficient for identifying pottery marks. The table of numerals on page 137 will be useful in this connection.

In the columns of Japanese marks the headings in heavy type are the names of provinces. Place-names have been printed in italics, where they might be otherwise confused with the names of potters, which are printed in ordinary type.

JAPANESE PORCELAIN

THE pioneer of Japanese porcelain was Gorodayu Go-Shonsui, who spent five years in China learning the art at Ching-tê-chên. Returning to Japan in 1515 he made blue and white porcelain with imported Chinese materials; but as he was unable to find the necessary clay in Japan, his success was only temporary and left nothing behind but the knowledge of painting in blue under a glaze. The requisite materials, however, were discovered in the province of Hizen by a Corean named Risampeï, about the year 1605, and forty years later two potters named Tokuemon and Kakiemon, with some help from a Chinese, developed the art of painting in enamel colours. A flourishing industry now sprang up in the village of Arita and its neighbourhood, and much of the ware found its way to Europe on Dutch ships trading with Imari, the sea-port of the Arita district. This "Old Japan" porcelain falls roughly into two classes: (1) a fine white ware with delicate and sparse decoration of floral sprays, birds, and animals in brilliant enamels, blue, manganese-purple, green, and red—commonly called Kakiemon ware; and (2) a heavier, greyer porcelain with crowded ornaments chiefly in dark impure blue, soft Indian red, and gold, obviously made for export, and commonly called Old Imari ware. Two other factories in the province of Hizen were celebrated in the eighteenth and the first half of the nineteenth centuries; the one at Okawaji, under the patronage of the feudal chief of Nabeshima, and the other at Mikawaji, taken under the protection of the chief of Hirado in 1751. The Hirado porcelain was the finest made in Japan; and the best specimens were painted in a pale but pure blue of great delicacy, a favourite subject being boys playing under an ancient pine, the number of boys, seven, five, or three, indicating the quality of the piece.

In 1660 Goto Saji, a native of the province of Kaga, set out to discover the secrets of the Arita potters, and from his return in 1664 dates the growth of a flourishing industry at Kutani-mura and its neighbouring villages. Kaga porcelain was chiefly noted for its rich enamels—blue, green, purple, and red—either painted in the Arita style or laid on in broad washes over formal designs pencilled in black. In the nineteenth century a specialty was made of decoration in red and gold, which has come to be regarded as typical of Kaga ware.

The Kioto potters did not turn their attention to porcelain till the end of the eighteenth century. Eisen was the first and he was followed by Mokubei, Rokubei, Eiraku, Dohachi, and a number of other clever potters. The Seto factories, destined to be the most productive in Japan, owe their knowledge of porcelain-making to Kato Tamikichi, who penetrated the secrets of the Arita potters in the first decade of the nineteenth century.

Chinese influence is almost always apparent in Japanese porcelain, and the early wares, if marked at all, usually display a Chinese date,¹ symbol, or mark of commendation. Moreover, the better factories were directly under the patronage of a feudal chief who did not permit the workmen's names to appear on the wares. Thus it is not till the nineteenth century that true potters' marks are common on Japanese porcelain; and much of the older wares have no mark at all. Marks beginning with the words "*Dai Nippon*" (see p. 186) may be safely regarded as of nineteenth-century date.

¹ Such as the *nienhao* of the Ch'êng Hua (Jap. Seika), Chia Ching (Jap. Ka-sei), Wan Li (Jap. Man-reki), Ch'ien Lung (Jap. Ken-riu) for which see p. 135.

TO BE COMPLETED IN TEN VOLUMES

Super Royal 8vo. 25s. net each

A CATALOGUE RAISONNÉ

OF THE WORKS OF THE

MOST EMINENT DUTCH PAINTERS
OF THE SEVENTEENTH CENTURY

BASED ON THE WORK OF

JOHN SMITH

BY

C. HOFSTEDE DE GROOT

TRANSLATED AND EDITED BY

EDWARD G. HAWKE

Vol. I. includes the Works of

JAN STEEN, GABRIEL METSU, GERARD DOU, PIETER DE
HOOCH, CAREL FABRITIUS, AND JOHANNES VERMEER

Vol. II. includes the Works of

AELBERT CUYP AND PHILIPS WOUWERMAN

Vol. III. will include the Works of

FRANS HALS, ADRIAEN VAN OSTADE, ISACK VAN
OSTADE, AND ADRIAEN BROUWER

As an indispensable work of reference for the collector, the student of Art, and the dealer, this great work in ten volumes, the first of which appeared a year ago, will replace, so far as the Dutch painters are concerned, the meritorious but now obsolete catalogue which John Smith, the famous dealer, compiled seventy years ago.
